Abstract. The concept of a type-2 fuzzy set was introduced by Zadeh as an extension of an ordinary fuzzy set. Type-2 fuzzy sets have grades of membership that are themselves fuzzy. Hence the membership function of a type-2 fuzzy set is three dimensional, and it is the new third dimension that provides new design degrees of freedom for handling uncertainties. Also fuzzy matrices play an important role in scientific developments. In this paper, the concept of bidiagonal type-2 triangular fuzzy matrices is proposed. Also some properties of bidiagonal type-2 triangular fuzzy matrices are presented.

Keywords: Type-2 fuzzy set, Type-2 triangular fuzzy number, Type-2 triangular fuzzy matrices.

AMS Mathematics Subject Classification (2010): 15B15

1. Introduction

The concept of a type-2 fuzzy set, which is an extension of the concept of an ordinary fuzzy set, was introduced by Zadeh in 1975 [14]. A type-2 fuzzy set is characterized by a membership function, i.e., the membership value for each element of this set is a fuzzy set in [0,1], unlike an ordinary fuzzy set where the membership value is a crisp number in [0,1]. Hisdal [1] discussed the IF THEN ELSE statement and interval-valued fuzzy sets of higher type. Jhon [2] studied an appraisal of theory and applications on type-2 fuzzy sets. Stephen Dinagar and Anbalagan [8] presented new ranking function and arithmetic operations on generalized type-2 trapezoidal fuzzy numbers.

The paper is organized as follows. Firstly in section-2 of this paper, we recall the definition of type-2 triangular fuzzy number and some operations on type-2 triangular
fuzzy numbers. In section-3, we review the definition of type-2 triangular fuzzy matrices (T2TFM) and some operations on T2TFMs. In section-4, we define bidiagonal-type-2 triangular fuzzy matrices. In section-5, we derive some properties of bidiagonal T2TFMs. Finally in section-6, conclusion is also included.

2. Preliminaries: type-2 triangular fuzzy numbers

**Definition 2.1. Fuzzy set**

A fuzzy set is characterized by a membership function mapping the elements of a domain, space or universe of discourse $X$ to the unit interval $[0,1]$. A fuzzy set $A$ in a universe of discourse $X$ is defined as the following set of pairs:

$$A = \{(x, \mu_A(x)); x \in X\}.$$ 

Here $\mu_A: X \to [0,1]$ is a mapping called the degree of membership function of the fuzzy set $A$ and $\mu_A(x)$ is called the membership value of $x \in X$ in the fuzzy set $A$. These membership grades are often represented by real numbers ranging from $[0,1]$.

**Definition 2.2. (Zadeh) Type-2 fuzzy set**

A type-2 fuzzy set is a fuzzy set whose membership values are fuzzy sets on $[0,1]$. A type-2 fuzzy set $A$ in a universe of discourse $X$ is defined as the following set of pairs:

$$A = \{(x, \mu_A(x)); x \in X\}.$$ 

**Definition 2.3.**

The type-2 fuzzy sets are defined by functions of the form $\tilde{g}_2: x \to \chi([0,1])$ where $\chi([0,1])$ denotes the set of all ordinary fuzzy sets that can be defined within the universal set $[0,1]$. An example [4] of a membership function of this type is given in fig.1.

![Figure 1: Illustration of the concept of a fuzzy set of type-2.](image)

**Definition 2.4. Type-2 fuzzy number** [8]

Let $\tilde{A}$ be a type-2 fuzzy number defined in the universe of discourse $R$. If the following conditions are satisfied:

(i) $\tilde{A}$ is normal,

(ii) $\tilde{A}$ is a convex set,

(iii) The support of $\tilde{A}$ is closed and bounded, then $\tilde{A}$ is called a type-2 fuzzy number.

**Definition 2.5. Type-2 triangular fuzzy number**
A Study on Bidiagonal Type-2 Triangular Fuzzy Matrices

A type-2 triangular fuzzy number $\tilde{A}$ on R is given by $\tilde{A} = \{x, (\mu_A^L(x), \mu_A^M(x), \mu_A^U(x)) ; x \in R\}$ and $\mu_A^L(x) \leq \mu_A^M(x) \leq \mu_A^U(x)$, for all $x \in R$. Denote $\tilde{A} = (\tilde{A}_1, \tilde{A}_2, \tilde{A}_3)$, where $\tilde{A}_1 = (A_1^L, A_1^U, A_1^M)$, $\tilde{A}_2 = (A_2^L, A_2^M, A_2^U)$ and $\tilde{A}_3 = (A_3^L, A_3^M, A_3^U)$ are same type of fuzzy numbers.

2.6. Arithmetic operations on type-2 triangular fuzzy numbers [9]

Let $\tilde{A} = (\tilde{a}_1, \tilde{a}_2, \tilde{a}_3) = ((a_1^L, a_1^M, a_1^U), (a_2^L, a_2^M, a_2^U), (a_3^L, a_3^M, a_3^U))$ and $\tilde{b} = (\tilde{b}_1, \tilde{b}_2, \tilde{b}_3) = ((b_1^L, b_1^M, b_1^U), (b_2^L, b_2^M, b_2^U), (b_3^L, b_3^M, b_3^U))$ be two type-2 triangular fuzzy numbers. Then we define,

(i) Addition:

$$\tilde{a} + \tilde{b} = ((a_1^L + b_1^L, a_1^M + b_1^M, a_1^U + b_1^U), (a_2^L + b_2^L, a_2^M + b_2^M, a_2^U + b_2^U), (a_3^L + b_3^L, a_3^M + b_3^M, a_3^U + b_3^U))$$

(ii) Subtraction:

$$\tilde{a} - \tilde{b} = ((a_1^L - b_1^L, a_1^M - b_1^M, a_1^U - b_1^U), (a_2^L - b_2^L, a_2^M - b_2^M, a_2^U - b_2^U), (a_3^L - b_3^L, a_3^M - b_3^M, a_3^U - b_3^U))$$

(iii) Scalar multiplication:

If $k \geq 0$ and $k \in R$ then $k\tilde{a} = ((ka_1^L, ka_1^M, ka_1^U), (ka_2^L, ka_2^M, ka_2^U), (ka_3^L, ka_3^M, ka_3^U))$ and if $k \leq 0$ and $k \in R$ then $k\tilde{a} = ((ka_1^L, ka_1^M, ka_1^U), (ka_2^L, ka_2^M, ka_2^U), (ka_3^L, ka_3^M, ka_3^U))$.

(iv) Multiplication:

Define $\sigma b = b_1^L + b_1^M + b_1^U + b_2^L + b_2^M + b_2^U + b_3^L + b_3^M + b_3^U$. If $\sigma b \geq 0$, then

$$\tilde{a} \times \tilde{b} = ((a_1^L b_1^L, a_1^M b_1^M, a_1^U b_1^U), (a_2^L b_2^L, a_2^M b_2^M, a_2^U b_2^U), (a_3^L b_3^L, a_3^M b_3^M, a_3^U b_3^U))$$

If $\sigma b < 0$, then

$$\tilde{a} \times \tilde{b} = ((a_1^L b_1^L, a_1^M b_1^M, a_1^U b_1^U), (a_2^L b_2^L, a_2^M b_2^M, a_2^U b_2^U), (a_3^L b_3^L, a_3^M b_3^M, a_3^U b_3^U))$$

(v) Division:

Whenever $\sigma b \neq 0$ we define division as follows: If $\sigma b > 0$, then

$$\frac{\tilde{a}}{\tilde{b}} = (\frac{\rho_{a_1}^L}{\rho_{b_1}^L}, \frac{\rho_{a_1}^M}{\rho_{b_1}^M}, \frac{\rho_{a_1}^U}{\rho_{b_1}^U}), (\frac{\rho_{a_2}^L}{\rho_{b_2}^L}, \frac{\rho_{a_2}^M}{\rho_{b_2}^M}, \frac{\rho_{a_2}^U}{\rho_{b_2}^U}), (\frac{\rho_{a_3}^L}{\rho_{b_3}^L}, \frac{\rho_{a_3}^M}{\rho_{b_3}^M}, \frac{\rho_{a_3}^U}{\rho_{b_3}^U})$$

If $\sigma b < 0$, then

$$\frac{\tilde{a}}{\tilde{b}} = (\frac{\rho_{a_1}^L}{\rho_{b_1}^L}, \frac{\rho_{a_1}^M}{\rho_{b_1}^M}, \frac{\rho_{a_1}^U}{\rho_{b_1}^U}), (\frac{\rho_{a_2}^L}{\rho_{b_2}^L}, \frac{\rho_{a_2}^M}{\rho_{b_2}^M}, \frac{\rho_{a_2}^U}{\rho_{b_2}^U}), (\frac{\rho_{a_3}^L}{\rho_{b_3}^L}, \frac{\rho_{a_3}^M}{\rho_{b_3}^M}, \frac{\rho_{a_3}^U}{\rho_{b_3}^U})$$

2.7. The proposed ranking function [9]

Let $F(R)$ be the set of all type-2 normal triangular fuzzy numbers. One convenient approach for solving numerical valued problem is based on the concept of comparison of fuzzy numbers by use of ranking function. An effective approach for ordering the elements of $F(R)$ is to define a linear ranking function $\tilde{R} : F(R) \rightarrow R$ which maps each fuzzy number into R.

Suppose $\tilde{A} = (\tilde{A}_1, \tilde{A}_2, \tilde{A}_3, \tilde{A}_4) = ((A_1^L, A_1^M, A_1^U), (A_2^L, A_2^M, A_2^U), (A_3^L, A_3^M, A_3^U))$ then we define $\tilde{R} (\tilde{A}) = (A_1^L + A_1^U + A_2^L + A_2^U + A_3^L + A_3^U) / 9$. 

11
Also we define orders on \( F(R) \) by
\[
\hat{R}(\hat{A}) \geq \hat{R}(\hat{B}) \text{ if and only if } \hat{A} \hat{B},
\[
\hat{R}(\hat{A}) \leq \hat{R}(\hat{B}) \text{ if and only if } \hat{A} \hat{B},
\]
and \( \hat{R}(\hat{A}) = \hat{R}(\hat{B}) \) if and only if \( \hat{A} \hat{B} \).

**Definition 2.8. Type-2 zero triangular fuzzy number**
If \( \hat{A} = ((0,0,0),(0,0,0),(0,0,0)) \) then \( \hat{A} \) is said to be a type-2 zero triangular fuzzy number. It is denoted by \( 0 \).

**Definition 2.9. Type-2 zero-equivalent triangular fuzzy number**
A type-2 triangular fuzzy number \( \hat{A} \) is said to be a type-2 zero-equivalent triangular fuzzy number if \( \hat{R}(\hat{A}) = 0 \). It is denoted by \( 0 \).

3. **Type-2 triangular fuzzy matrices (T2TFMs) [9]**

**Definition 3.1. Type-2 triangular fuzzy matrix (T2TFM)**
A type-2 triangular fuzzy matrix (T2TFM) of order \( m \times n \) is defined as \( A = (\hat{a}_{ij}) \) where the \( ij^{th} \) element \( \hat{a}_{ij} \) of \( A \) is the type-2 triangular fuzzy number.

**3.2. Operations on T2TFMs**
As for classical matrices we define the following operations on T2TFMs. Let \( A = (\hat{a}_{ij}) \) and \( B = (\hat{b}_{ij}) \) be two T2TFMs of same order. Then we have the following:

(i) \( A + B = (\hat{a}_{ij} + \hat{b}_{ij}) \)

(ii) \( A - B = (\hat{a}_{ij} - \hat{b}_{ij}) \)

(iii) For \( A = (\hat{a}_{ij}) \) and \( B = (\hat{b}_{ij}) \) then \( AB = (\hat{c}_{ij}) \) where \( \hat{c}_{ij} = \sum_{p=1}^{n} a_{ip} \cdot b_{pj} \)

(iv) \( A^T \) or \( A^c = (\hat{a}_{ji}) \)

(v) \( kA = (k\hat{a}_{ij}) \), where \( k \) is a scalar.

4. **Bidiagonal type-2 triangular fuzzy matrices**

**Definition 4.1. Diagonal T2TFM**
A square T2TFM \( A = (\hat{a}_{ij}) \) is said to be a diagonal T2TFM if all the elements outside the principal diagonal are 0.

**Definition 4.2. Diagonal-equivalent T2TFM**
A square T2TFM \( A = (\hat{a}_{ij}) \) is said to be a diagonal - equivalent T2TFM if all the elements outside the principal diagonal are \( \hat{0} \).

**Definition 4.3. Upper bidiagonal T2TFM**
A square T2TFM \( A = (\hat{a}_{ij}) \) is called an upper bidiagonal T2TFM if the diagonal and above the main diagonal has the non-zero entries and all the other entries are 0.
A Study on Bidiagonal Type-2 Triangular Fuzzy Matrices

For example $A = \begin{pmatrix}
\tilde{g}_{17} & \tilde{g}_{16} & \tilde{g}_{15} & \tilde{g}_{18} & \tilde{g}_{35} & \tilde{g}_{36} \\
\tilde{g}_{28} & \tilde{g}_{29} & \tilde{g}_{18} & \tilde{g}_{35} & \tilde{g}_{36} & \tilde{g}_{28} \\
0 & 0 & 0 & \tilde{g}_{18} & \tilde{g}_{35} & \tilde{g}_{36} \\
\end{pmatrix}$

**Definition 4.4. Upper bidiagonal-equivalent T2TFM**
A square T2TFM $A = (\tilde{a}_{ij})$ is called an upper bidiagonal-equivalent T2TFM if the diagonal and above the main diagonal has the non-zero entries and all the other entries are $0$.

**Definition 4.5. Lower bidiagonal T2TFM**
A square T2TFM $A = (\tilde{a}_{ij})$ is called a lower bidiagonal T2TFM if the diagonal and below the main diagonal has the non-zero entries and all the other entries are $0$.

**Definition 4.6. Lower bidiagonal-equivalent T2TFM**
A square T2TFM $A = (\tilde{a}_{ij})$ is called a lower bidiagonal-equivalent T2TFM if the diagonal and below the main diagonal has the non-zero entries and all the other entries are $0$.

**Definition 4.7. Bidiagonal T2TFM**
A square T2TFM $A = (\tilde{a}_{ij})$ is called a bidiagonal T2TFM if it is either an upper bidiagonal T2TFM or a lower bidiagonal T2TFM.

**Definition 4.8. Bidiagonal-equivalent T2TFM**
A square T2TFM $A = (\tilde{a}_{ij})$ is called a bidiagonal-equivalent T2TFM if it is either an upper bidiagonal-equivalent T2TFM or a lower bidiagonal-equivalent T2TFM.

**5. Properties of bidiagonal T2TFMs**

**Property 5.1.** The sum of two upper bidiagonal T2TFMs of order $n$ is also an upper bidiagonal T2TFM of order $n$.

**Proof:** Let $A = (\tilde{a}_{ij})$ and $B = (\tilde{b}_{ij})$ be two upper bidiagonal T2TFMs. Since $A$ and $B$ are upper bidiagonal T2TFMs, $\tilde{a}_{ij} = 0$ and $\tilde{b}_{ij} = 0$ for all $i > j$ and $i+2 \leq j$; $i, j = 1, 2, ..., n$.

Let $A + B = C$. Then $(\tilde{a}_{ij} + \tilde{b}_{ij}) = (\tilde{c}_{ij})$.

For all $i > j$ and $i+2 \leq j$; $i, j = 1, 2, ..., n$, $\tilde{c}_{ij} = \tilde{a}_{ij} + \tilde{b}_{ij} = 0 + 0 = 0$.

Hence $C$ is also an upper bidiagonal T2TFM of order $n$.

**Property 5.2.** The sum of two lower bidiagonal T2TFMs of order $n$ is also a lower bidiagonal T2TFM of order $n$.
Proof: Let \( A = (\tilde{a}_{ij}) \) and \( B = (\tilde{b}_{ij}) \) be two lower bidiagonal T2TFMs. Since \( A \) and \( B \) are lower bidiagonal T2TFMs, \( \tilde{a}_{ij} = 0 \) and \( \tilde{b}_{ij} = 0 \) for all \( i < j \) and \( i \geq j + 2; i, j = 1, 2, \ldots, n. \)

Let \( A + B = C \). Then \( (\tilde{a}_{ij} + \tilde{b}_{ij}) = (\tilde{c}_{ij}) \).

For all \( i < j \) and \( i \geq j + 2; i, j = 1, 2, \ldots, n. \) \( \tilde{c}_{ij} = \tilde{a}_{ij} + \tilde{b}_{ij} = 0 + 0 = 0. \)

Hence \( C \) is also a lower bidiagonal T2TFM of order \( n. \)

**Property 5.3.** The product of an upper bidiagonal T2TFM by a scalar is also an upper bidiagonal T2TFM.

Proof: Let \( A = (\tilde{a}_{ij}) \) be an upper bidiagonal T2TFM. Since \( A \) is an upper bidiagonal T2TFM, \( \tilde{a}_{ij} = 0 \) for all \( i > j \) and \( i + 2 \leq j; i, j = 1, 2, \ldots, n. \)

Let \( k \) be a scalar and \( kA = B \). Then \( (k\tilde{a}_{ij}) = (\tilde{b}_{ij}). \)

For all \( i > j \) and \( i + 2 \leq j; i, j = 1, 2, \ldots, n, \) \( \tilde{b}_{ij} = k\tilde{a}_{ij} = k0 = 0. \)

Hence \( B \) is also an upper bidiagonal T2TFM.

**Property 5.4.** The product of a lower bidiagonal T2TFM by a scalar is also a lower bidiagonal T2TFM.

Proof: Let \( A = (\tilde{a}_{ij}) \) be a lower bidiagonal T2TFM. Since \( A \) is a lower bidiagonal T2TFM, \( \tilde{a}_{ij} = 0 \) for all \( i < j \) and \( i \geq j + 2; i, j = 1, 2, \ldots, n. \)

Let \( k \) be a scalar and \( kA = B \). Then \( (k\tilde{a}_{ij}) = (\tilde{b}_{ij}). \)

For all \( i < j \) and \( i \geq j + 2; i, j = 1, 2, \ldots, n, \) \( \tilde{b}_{ij} = k\tilde{a}_{ij} = k0 = 0. \)

Hence \( B \) is also a lower bidiagonal T2TFM.

**Property 5.5.** The transpose of an upper bidiagonal T2TFM is a lower bidiagonal T2TFM and vice versa.

Proof: Let \( A = (\tilde{a}_{ij}) \) be an upper bidiagonal T2TFM. Since \( A \) is an upper bidiagonal T2TFM, \( \tilde{a}_{ij} = 0 \) for all \( i > j \) and \( i + 2 \leq j; i, j = 1, 2, \ldots, n. \)

Let \( B \) be the transpose of \( A \). Then \( A' = B. \) i.e. \( (\tilde{a}_{ji}) = (\tilde{b}_{ji}). \)

For all \( i > j \) and \( i + 2 \leq j; i, j = 1, 2, \ldots, n, \) \( \tilde{a}_{ij} = 0 = \tilde{b}_{ji}. \)

That is for all \( i < j \) and \( i \geq j + 2; i, j = 1, 2, \ldots, n, \) \( \tilde{b}_{ij} = 0. \)

Hence \( B \) is a lower bidiagonal T2TFM.

Remark: However, operations mixing upper bidiagonal and lower bidiagonal T2TFMs do not produce bidiagonal T2TFMs. For instance, the sum of upper bidiagonal and lower bidiagonal T2TFM can be any T2TFM (In particular tridiagonal T2TFM).

6. Conclusion

In this article, bidiagonal type-2 triangular fuzzy matrices are defined. Also some properties of bidiagonal T2TFMs are proved. Using these results of T2TFMs, some important properties of T2TFMs, involving the notion like tridiagonal T2TFM, pentadiagonal T2TFM etc., can be studied in future. Also the theories of the discussed T2TFMs may be utilized in further works.
