#### Abstract

In this paper, Myhill Nerode theorem of finite automaton has been extended to fuzzy automaton where the composition considered is min-max composition. In the case of max-min composition, it has already been proved that if L is a fuzzy regular language, then for any $\alpha \in[0,1], \mathrm{L}_{\alpha}=\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)$ [3]. In the case of max-product composition $\mathrm{L}_{\alpha}$ is only a subset of $\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)$. But still Myhill Nerode theorem has been extended to max-product composition [4]. In the case of max-average composition, $\mathrm{L}_{\alpha}$ is not even contained in $\mathrm{L}\left(\mathrm{D}_{\alpha}\right.$ (M)). This lead to lots of challenges and we had to resort to splitting to prove the analogue of Myhill Nerode Theorem for max-average composition. In a similar line, an attempt has been made in this paper to study the behavior of fuzzy automata under min-max composition and to prove the analogue of Myhill Nerode Theorem for min - max composition. An algorithm to compute $\mathrm{L}(\mathrm{s})$ for any string $s$ is also developed.

Keywords: Monoid, min-max composition, finite automaton, equivalence class, fuzzy regular language, fuzzy automaton

## AMS Mathematics Subject Classification (2010): 68Q45, 68Q70

## 1. Introduction

Let $A$ be a finite non empty set. A fuzzy automaton over $A$ is a 4-tuple $M=(Q, f, I, F)$ where Q is a finite nonempty set, f is a fuzzy subset of $\mathrm{Q} \times \mathrm{A} \times \mathrm{Q}, \mathrm{I}$ and F are fuzzy subsets of Q . In other words, $\mathrm{f}: \mathrm{Q} \times \mathrm{A} x \mathrm{Q} \rightarrow[0,1]$ and $\mathrm{I}, \mathrm{F}: \mathrm{Q} \rightarrow[0,1]$.
Let $S$ be a free monoid with identity element e generated by $A$. If $s \in S$, then $s$ can be written as $a_{1} a_{2} \ldots a_{n}$ where $a_{i} \in A$. Here $n$ is called the length of $s$ and we write $|s|=n$. We now extend $f$ to a function $f^{*}: Q \times S \times Q \rightarrow[0,1]$ defined as

$$
\begin{aligned}
f^{*}(q, e, p)= & 0 \text { if } q=p, \quad 1 \text { otherwise. } \\
f^{*}(q, s a, p)= & \wedge\left[f^{*}(q, s, r) \vee f(r, a, p)\right] \quad(s \in S, a \in A) \\
& r \in Q
\end{aligned}
$$

It can be shown that $f^{*}(q, a, p)=f(q, a, p)$ for all $p, q \in Q$ and for all $a \in A$.

## Myhill Nerode Theorem for Fuzzy Automata (Min-max Composition)

Definition 1.1. Let $\mathrm{M}=\left(\mathrm{Q}, \mathrm{f}^{*}, \mathrm{I}, \mathrm{F}\right)$ be a fuzzy automaton over S . We define the language accepted by $M$ denoted by $L(M)$ to be a fuzzy subset of $S$ defined as $L(M)(s)=I f_{s}^{*} \circ \mathrm{~F}$ for all $\mathrm{s} \in \mathrm{S}$. Here o denotes min-max composition.

Definition 1.2. A fuzzy subset $L$ of $S$ is said to be a fuzzy regular language if $L=L(M)$ where $M$ is a fuzzy automaton over $S$.

## 2. Myhill Nerode Theorem for Fuzzy Automata

Let $S$ be a monoid with identity element e and $L$ be a fuzzy subset of $S$. Then the following statements are equivalent.
(i) L is a fuzzy regular language.
(ii) L can be expressed as a fuzzy union
$\mathrm{L}=\left(\delta_{1}\right)_{\mathrm{L}} \cup\left(\delta_{2}\right)_{\mathrm{L}} \cup \ldots \cup\left(\delta_{\mathrm{t}}\right)_{\mathrm{L}}$ where $\delta_{1}, \delta_{2}, \ldots \delta_{\mathrm{t}} \in[0,1]$. For each $\mathrm{i}=1,2 \ldots \mathrm{t},(\delta \mathrm{i})_{\mathrm{L}}=\delta \mathrm{i}$. $\mathrm{L}_{\delta \mathrm{i}}$ where $\mathrm{L}_{\delta \mathrm{i}}=\mathrm{U}[\mathrm{s}]_{\delta \mathrm{i}}$.
This union is a set theoretic union and $[\mathrm{s}]_{\delta i}$ denotes the equivalence class of s of a right invariant equivalence relation of finite index in $L_{\delta i}$.
(iii) Define a relation $R_{L}$ as follows.

If $s, t \varepsilon S$, then $s R_{L} t$ if and only if for all $u \in S$ and for all $\alpha \in[0,1], L(s u) \geq \alpha$ only when $L(t u) \geq \alpha$. Then $R_{L}$ is a right invariant equivalence relation of finite index.
Proof: (i) $\rightarrow$ (ii)
Since $L$ is a fuzzy regular language, we have $L=L(M)$ where $M=\left(Q, f^{*}, I, F\right)$ is a fuzzy automaton. Consider any $\alpha \in[0,1]$. With M and $\alpha$, we associate a non-deterministic automaton $\mathrm{D}_{\alpha}(\mathrm{M})=\left(\mathrm{Q}, \mathrm{d}_{\alpha}, \mathrm{I}_{\alpha}, \mathrm{F}_{\alpha}\right)$ where
$d_{\alpha}: Q \times S \rightarrow 2^{Q}$ is defined as $d_{\alpha}(q, s)=\left\{p \in Q \mid f^{*}(q, s, p) \geq \alpha\right\}$,
$\mathrm{I}_{\alpha}=\{\mathrm{p} \in \mathrm{Q} \mid \mathrm{I}(\mathrm{p}) \geq \alpha\}$ and
$F_{\alpha}=\{p \in Q \mid F(p) \geq \alpha\}$.
For the sake of simplicity, we will denote $\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)$ by $\mathrm{L}_{\alpha}(\mathrm{M})$.
Let $\mathrm{s} \in \mathrm{L}_{\alpha}$. Then $\mathrm{L}(\mathrm{s})=\mathrm{L}(\mathrm{M})(\mathrm{s}) \geq \alpha$. ie $\left(\mathrm{I} \mathrm{of}_{\mathrm{s}}{ }^{*} \mathrm{of}\right) \geq \alpha$ which means

```
    \(\wedge\left[\left(\mathrm{f}_{\mathrm{s}}{ }^{*} \circ \mathrm{o}\right)(\mathrm{p}) \vee \mathrm{I}(\mathrm{p})\right] \geq \alpha\)
\(\mathrm{p} \in \mathrm{Q}\)
```

This means for any state $p \in Q, I(p) \geq \alpha$ OR ( $\left.f_{s} * \sim F\right)(p) \geq \alpha$. This leads to the following three cases:
Case A: $\mathrm{I}(\mathrm{p}) \geq \alpha$ and $\left(\mathrm{f}_{\mathrm{s}}{ }^{*} \mathrm{oF}\right)(\mathrm{p}) \geq \alpha$
Case B: $\mathrm{I}(\mathrm{p})<\alpha$ and $\left(\mathrm{f}_{\mathrm{s}}^{*} \mathrm{oF}\right)(\mathrm{p}) \geq \alpha$
Case C: $I(p) \geq \alpha$ and $\left(f_{s} * o F\right)(p)<\alpha$
We now consider each case separately.
Case A: $I(p) \geq \alpha$ and $\left(f_{s}^{*} o F\right)(p) \geq \alpha$. In this case $p \in I_{\alpha}$.
Now ( $f_{s}^{*}$ o F) $(p) \geq \alpha$ means
$\wedge\left[\left(f_{s}^{*}(p, r) \vee F(r)\right] \geq \alpha\right.$
$r \in Q$
This leads to the following three cases:
Case $\mathbf{A}_{1}: \mathrm{f}_{\mathrm{s}}{ }^{*}(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r}) \geq \alpha$
Case $\mathbf{A}_{2}: \mathrm{f}_{\mathrm{s}}{ }^{*}(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r})<\alpha$
Case $A_{3}: \mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r})<\alpha$ and $\mathrm{F}(\mathrm{r}) \geq \alpha$
Case $\mathbf{A}_{1}: \mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r})=\mathrm{f}^{*}(\mathrm{p}, \mathrm{s}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r}) \geq \alpha$

## V. Ramaswamy and K.Chatrapathy

First alternative means $r \in d_{\alpha}(p, s) . F(r) \geq \alpha$ means $r \in F_{\alpha}$.
Thus $r \in d_{\alpha}(p, s) \cap F_{\alpha}$. Hence $d_{\alpha}(p, s) \cap F_{\alpha} \neq \phi$ where $p \in I_{\alpha}$. This proves that $\mathrm{s} \in \mathrm{L}(\mathrm{D} \alpha(\mathrm{M}))=\mathrm{L} \alpha(\mathrm{M})$.
Case $\mathbf{A}_{2}: \mathrm{f}_{\mathrm{s}} *(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r})<\alpha$
Let $\mathrm{F}(\mathrm{r})=\beta<\alpha$. Then $\mathrm{r} \in \mathrm{F}_{\beta}$. $\mathrm{I}(\mathrm{p}) \geq \alpha>\beta$ means
$p \in I_{\beta}$. Also $f_{s}^{*}(p, r) \geq \alpha>\beta$ means $r \in d_{\beta}(p, s)$.
Thus $r \in d_{\beta}(p, s)$ and $r \in F_{\beta}$ so that $d_{\beta}(p, s) \cap F_{\beta} \neq \phi$ where $p \in I_{\beta}$.
This proves that $s \in L\left(D_{\beta}(M)\right)=L_{\beta}(M)$.
Case $\mathbf{A}_{3}: \mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r})<\alpha$ and $\mathrm{F}(\mathrm{r}) \geq \alpha$
Let $\mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r})=\gamma<\alpha$. Then $\mathrm{f}^{*}(\mathrm{p}, \mathrm{s}, \mathrm{r})=\gamma$ so that $\mathrm{r} \in \mathrm{d}_{\gamma}(\mathrm{p}, \mathrm{s})$
$\mathrm{F}(\mathrm{r}) \geq \alpha>\gamma$ means $\mathrm{r} \in \mathrm{F}_{\gamma} . \mathrm{I}(\mathrm{p}) \geq \alpha>\gamma$ means $\mathrm{p} \in \mathrm{I}_{\gamma}$
Thus $\mathrm{r} \in \mathrm{d}_{\gamma}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F}_{\gamma}$ so that $\mathrm{d}_{\gamma}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F}_{\gamma} \neq \phi$ where $\mathrm{p} \in \mathrm{I}_{\gamma}$. This proves that
$\mathrm{s} \in \mathrm{L}\left(\mathrm{D}_{\gamma}(\mathrm{M})\right)=\mathrm{L}_{\gamma}(\mathrm{M})$
Case B: $\mathrm{I}(\mathrm{p})<\alpha$ and $\left(\mathrm{f}_{\mathrm{s}}{ }^{*} \mathrm{o} \mathrm{F}\right)(\mathrm{p})=\wedge\left[\left(\mathrm{f}_{\mathrm{s}}{ }^{*}(\mathrm{p}, \mathrm{r}) \vee \mathrm{F}(\mathrm{r})\right] \geq \alpha\right.$.

$$
\mathrm{r} \in \mathrm{Q}
$$

This leads to the following three cases.
Case $\mathbf{B}_{1}: \mathrm{f}_{\mathrm{s}} *(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r}) \geq \alpha$
Case $\mathrm{B}_{2}: \mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r})<\alpha$
Case $B_{3}: f_{s}^{*}(p, r)<\alpha$ and $F(r) \geq \alpha$
Case $B_{1}: f_{s} *(p, r) \geq \alpha$ and $F(r) \geq \alpha$. We already have $I(p)<\alpha$.
Let $\mathrm{I}(\mathrm{p})=\lambda<\alpha$. This implies $\mathrm{p} \in \mathrm{I}_{\lambda}$. Now $\mathrm{F}(\mathrm{r}) \geq \alpha>\lambda$ means $\mathrm{r} \in \mathrm{F}_{\lambda}$
and $\mathrm{f}_{\mathrm{s}}{ }^{*}(\mathrm{p}, \mathrm{r})=\mathrm{f}^{*}(\mathrm{p}, \mathrm{s}, \mathrm{r}) \geq \alpha>\lambda$ means $\mathrm{r} \in \mathrm{d}_{\lambda}(\mathrm{p}, \mathrm{s})$.
Thus $r \in d_{\lambda}(p, s) \cap F_{\lambda}$ so that $d_{\lambda}(p, s) \cap F_{\lambda} \neq \phi$ where $p \in I_{\lambda}$. This proves that $\mathrm{s} \in \mathrm{L}\left(\mathrm{D}_{\lambda}(\mathrm{M})\right)=\mathrm{L}_{\lambda}(\mathrm{M})$.
.Case $\mathrm{B}_{2}: \mathrm{f}_{\mathrm{s}}^{*}(\mathrm{p}, \mathrm{r}) \geq \alpha$ and $\mathrm{F}(\mathrm{r})<\alpha$. We already have $\mathrm{I}(\mathrm{p})<\alpha$.
Let $\mathrm{I}(\mathrm{p})=\rho<\alpha$. Then $\mathrm{p} \in \mathrm{I}_{\rho}$. Let $\mathrm{F}(\mathrm{r})=\varphi<\alpha$. Then $\mathrm{r} \in \mathrm{F}_{\varphi}$.
If $\rho>\varphi$, then $I_{\rho} \subseteq I_{\varphi}$ so that $p \in I_{\varphi}$. Also $f_{s}^{*}(p, r)=f^{*}(p, s, r) \geq \alpha>\rho>\varphi$ which
means $r \in d_{\varphi}(p, s)$. Thus there exists $p \in I_{\varphi}$ such that $d_{\varphi}(p, s) \cap F_{\varphi} \neq \phi$. This
proves that $\mathrm{s} \in \mathrm{L}\left(\mathrm{D}_{\varphi}(\mathrm{M})\right)=\mathrm{L}_{\varphi}(\mathrm{M})$.
If $\rho<\varphi$, then $r \in F_{\varphi} \subseteq F_{p}$ Also $f^{*}(p, s, r) \geq \alpha>\rho$ implies $r \in d_{\rho}(p, s)$. $I(p)=\rho$
means $p \in I_{\rho}$. Thus $r \in d_{\rho}(p, s) \cap F_{\rho}$ so that $d_{\rho}(p, s) \cap F_{\rho} \neq \phi$ where $p \in I_{\rho}$. This proves that $s \in L\left(D_{\rho}(M)\right)=L_{\rho}(M)$.
Case $B_{3}: f_{s}^{*}(p, r)<\alpha$ and $F(r) \geq \alpha$. We already have $I(p)<\alpha$.
Let $\mathrm{I}(\mathrm{p})=\pi<\alpha$. Then $\mathrm{p} \in \mathrm{I}_{\pi}$ and $\mathrm{F}(\mathrm{r}) \geq \alpha>\pi$ implies $\mathrm{r} \in \mathrm{F}_{\pi}$.
Let $f_{s}^{*}(p, r)=f^{*}(p, s, r)=\mu<\alpha$.
If $\mu \leq \pi$, then $F(r) \geq \alpha>\mu$ implies $r \in F \mu$ and $f^{*}(p, s, r)=\mu$ means $r \in d_{\mu}(p, s)$.
Also $\mathrm{I}(\mathrm{p})=\pi \geq \mu$ means $\mathrm{p} \in \mathrm{I}_{\mu}$. Thus $\mathrm{r} \in \mathrm{d}_{\mu}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F} \mu$ so that $\mathrm{d}_{\mu}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F} \mu \neq \phi$
where $\mathrm{p} \in \mathrm{I}_{\mu}$. This proves that $\mathrm{s} \in \mathrm{L}\left(\mathrm{D}_{\mu}(\mathrm{M})\right)=\mathrm{L}_{\mu}(\mathrm{M})$.
If $\mu>\pi$, then $\mathrm{f}^{*}(\mathrm{p}, \mathrm{s}, \mathrm{r})=\mu>\pi$ means $\mathrm{r} \in \mathrm{d}_{\pi}(\mathrm{p}, \mathrm{s})$. Thus $\mathrm{r} \in \mathrm{d}_{\pi}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F}_{\pi}$ so that $\mathrm{d}_{\pi}(\mathrm{p}, \mathrm{s}) \cap \mathrm{F}_{\pi} \neq \phi$ where $\mathrm{p} \in \mathrm{I} \pi$.
This proves that $s \in L\left(D_{\pi}(M)\right)=L_{\pi}(M)$.
Case C: $\mathrm{I}(\mathrm{p}) \geq \alpha$ and $\left(\mathrm{f}_{\mathrm{s}} * \circ \mathrm{~F}\right)(\mathrm{p})<\alpha$.
This implies $\mathrm{f}_{\mathrm{s}} *(\mathrm{p}, \mathrm{r})<\alpha$ and $\mathrm{F}(\mathrm{r})<\alpha$.

## Myhill Nerode Theorem for Fuzzy Automata (Min-max Composition)

We already have $\mathrm{I}(\mathrm{p}) \geq \alpha$.
Let $\mathrm{f}_{\mathrm{s}} *(\mathrm{p}, \mathrm{r})=v<\alpha$ and $\mathrm{F}(\mathrm{r})=\Omega<\alpha$.
First assume that $v>\Omega$. Now $F(r)=\Omega$ means $r \in F_{\Omega}$. Also
$f^{*}(p, s, r)=v \geq \Omega$ means $r \in d_{\Omega}(p, s)$. Hence $d_{\Omega}(p, s) \cap F_{\Omega} \neq \phi$. Also
$\mathrm{I}(\mathrm{p}) \geq \alpha>v>\Omega$ means $\mathrm{p} \in \mathrm{I}_{\Omega}$. Hence
$\mathrm{s} \in \mathrm{L}\left(\mathrm{D}_{\Omega}(\mathrm{M})\right)=\mathrm{L}_{\Omega}(\mathrm{M})$.
Suppose $v<\Omega$. Now $F(r)=\Omega>v$ means $r \in F_{v} . f^{*}(p, s, r)=v$ means
$r \in d_{v}(p, s)$ so that $d_{v}(p, s) \cap F_{v} \neq \phi$. Also $I(p) \geq \alpha>v$ means $p \in I_{v}$.
Hence $s \in L\left(D_{v}(M)\right)=L_{v}(M)$.
From (1), (2), (3), (4), (5), (6), (7), (8), (9), and (10) it follows that
$\mathrm{L}_{\alpha} \subseteq \mathrm{L}_{\alpha}(\mathrm{M}) \cup \mathrm{L}_{\beta}(\mathrm{M}) \cup \mathrm{L}_{\gamma}(\mathrm{M}) \cup \mathrm{L}_{\lambda}(\mathrm{M}) \cup \mathrm{L} \varphi(\mathrm{M}) \cup \mathrm{L} \rho(\mathrm{M}) \cup \mathrm{L} \mu(\mathrm{M}) \cup \mathrm{L}_{\pi}(\mathrm{M}) \cup \mathrm{L}_{\Omega}(\mathrm{M})$ $\cup L_{v}(M) \cup L_{\sigma}(M) \cup L_{\eta}(M)$ where $\alpha, \beta, \gamma, \lambda, \varphi, \rho, \pi, v, \Omega, \mu, \sigma, \eta \in[0,1]$.

Since each of the languages $L_{\alpha}(M), L_{\beta}(M), L_{\gamma}(M), \ldots \ldots L_{\pi}(M)$ are fuzzy regular languages accepted by non-deterministic automata $D_{\alpha}(M), D_{\beta}(M), D_{\gamma}(M), \ldots \ldots . D_{\pi}(M)$ respectively, Myhill Nerode theorem for finite automata is applicable for each automaton. Let $Q=\left\{q_{0}, q_{1}, q_{2} \ldots . q_{n}\right\}$. For every $s \in S$, the possible values of $L(s)$ are $I\left(q_{0}\right), I\left(q_{1}\right), \ldots I\left(q_{n}\right)$, $f\left(q_{i}, a_{j}, q_{k}\right)\left(q_{i}, q_{k} \in Q, a_{j} \in A\right), F\left(q_{0}\right), F\left(q_{1}\right), \ldots F\left(q_{n}\right)$. Denote these fixed values (after arranging them in non decreasing order) by $\delta_{1}, \delta_{2} \ldots \delta_{\mathrm{t}}$. So, there can be only finitely many values of $\mathrm{L}(\mathrm{s})(\mathrm{s} \in \mathrm{S})$. Then $\delta_{1}, \delta_{2} \ldots \delta_{\mathrm{t}} \in[0,1]$ and for each $\delta \mathrm{i}(1 \leq \mathrm{i} \leq \mathrm{t})$,
$\mathrm{L}_{\delta \mathrm{i}} \subseteq\left(\mathrm{L}_{\alpha}(\mathrm{M}) \cup \mathrm{L}_{\beta}(\mathrm{M}) \cup \mathrm{L}_{\gamma}(\mathrm{M}) \cup \mathrm{L}_{\lambda}(\mathrm{M}) \cup \mathrm{L} \varphi(\mathrm{M}) \cup \mathrm{L} \rho(\mathrm{M}) \cup \mathrm{L} \mu(\mathrm{M}) \cup \mathrm{L}_{\pi}(\mathrm{M}) \cup \mathrm{L}_{\Omega}(\mathrm{M}) \cup\right.$ $\left.L_{v}(M) \cup L_{\sigma}(M) \cup L_{\eta}(M)\right)$

Since $L\left(D_{\delta i}(M)\right)$ is the language accepted by a finite automaton, by Myhill Nerode theorem for finite automata, it follows that there exists a right invariant equivalence relation $\mathrm{R}_{\mathrm{i}}$ of finite index. Let $\mathrm{R}_{\mathrm{i}}^{\prime}$ denotes it's restriction on $\mathrm{L}_{\mathrm{\delta i}}$. Similarly, we obtain other restrictions like $M_{i}^{\prime}, N_{i}^{\prime}, O_{i}^{\prime}, P_{i}^{\prime}, Q_{i}^{\prime}, S_{i}^{\prime}, T_{i}^{\prime}, U_{i}^{\prime}, V_{i}^{\prime}, W_{i}^{\prime}, X_{i}^{\prime}$, and $Y_{i}^{\prime}$ from $L\left(D_{\alpha i}(M), L\left(D_{\beta i}(M), L\left(D_{\gamma i}\right.\right.\right.$ $(M), L\left(D_{\lambda i}(M), L\left(D_{\varphi i}(M)\right), L\left(D_{\rho i}(M)\right), L\left(D_{\pi i}(M)\right), L\left(D_{v i}(M)\right), L\left(D_{\Omega i}(M)\right), L\left(D_{\mu i}(M)\right)\right.$, $L\left(D_{\sigma i}(M)\right), \quad L\left(D_{\eta i}(M)\right)$ respectively. Note that $M_{i}^{\prime}, N_{i}^{\prime}, O_{i}^{\prime}, P_{i}^{\prime}, \mathrm{Q}_{\mathrm{i}}^{\prime}, S_{i}^{\prime}, T_{i}^{\prime}, U_{i}^{\prime}, V_{i}^{\prime}, W_{i}^{\prime}, X_{i}^{\prime}$, and $Y_{i}^{\prime}$ are all right invariant equivalence relations of finite index. Hence $Z_{i}{ }^{\prime}=M_{i}{ }^{\prime} \cap N_{i}{ }^{\prime} \cap O_{i}{ }^{\prime}$ $\cap \mathrm{P}_{\mathrm{i}}^{\prime} \cap \mathrm{Q}_{\mathrm{i}}^{\prime} \cap \mathrm{S}_{\mathrm{i}}^{\prime} \cap \mathrm{T}_{\mathrm{i}}^{\prime} \cap \mathrm{U}_{\mathrm{i}}^{\prime} \cap \mathrm{V}_{\mathrm{i}}^{\prime} \cap \mathrm{W}_{\mathrm{i}}^{\prime} \cap \mathrm{X}_{\mathrm{i}}^{\prime} \cap \mathrm{Y}_{\mathrm{i}}^{\prime}$ is a right invariant equivalence relation in $L_{\delta i}$ of finite index. Let $[s]_{\delta i}$ denote the equivalence class of $S$ under this equivalence relation. Since the equivalence classes partition $L_{\delta i}$, it follows that $L_{\delta i}=\cup[s]_{\delta i}$.
Next we will prove the fact that $\mathrm{L}=\left(\delta_{1}\right)_{\mathrm{L}} \cup\left(\delta_{2}\right)_{\mathrm{L}} \cup \ldots \cup\left(\delta_{\mathrm{t}}\right)_{\mathrm{L}}$.
Define $\left(\delta_{\mathrm{i}}\right)_{\mathrm{L}}=\delta_{\mathrm{i}}$. $\mathrm{L}_{\delta \mathrm{i}}$. If $\mathrm{s} \in \mathrm{S}$ such that $\mathrm{L}(\mathrm{s}) \geq \delta_{\mathrm{i}}\left(\mathrm{s} \in \mathrm{L}_{\delta_{\mathrm{i}}}\right)$, then $\left(\delta_{\mathrm{i}}\right)_{\mathrm{L}}(\mathrm{s})=\delta_{\mathrm{i}}$. Otherwise, $\quad\left(\delta_{\mathrm{i}}\right)_{\mathrm{L}}(\mathrm{s})=0$. We note that each $\left(\delta_{\mathrm{i}}\right)_{\mathrm{L}}$ is a fuzzy set. Let $\mathrm{s} \in \mathrm{S}$ and assume that $\mathrm{L}(\mathrm{s})=\delta_{\mathrm{i}}$. Now $\mathrm{L}(\mathrm{s})=\delta_{\mathrm{i}} \leq \delta_{\mathrm{i}+1} \leq \ldots \leq \delta_{\mathrm{t}}$. Again, $\mathrm{L}(\mathrm{s})=\delta_{\mathrm{i}} \geq \delta_{\mathrm{i}-1} \geq \ldots \geq \delta_{1}$.
Hence $\left(\left(\delta_{1}\right)_{\mathrm{L}} \cup\left(\delta_{2}\right)_{\mathrm{L}} \cup \ldots \cup\left(\delta_{\mathrm{t}}\right)_{\mathrm{L}}\right)(\mathrm{s})=\left(\delta_{1}\right)_{\mathrm{L}}(\mathrm{s}) \vee\left(\delta_{2}\right)_{\mathrm{L}}(\mathrm{s}) \vee \ldots\left(\delta_{\mathrm{t}}\right)_{\mathrm{L}}(\mathrm{s})=\delta_{1} \vee \delta_{2} \vee \ldots \vee \delta_{\mathrm{i}}=\delta_{\mathrm{i}}$ $=\mathrm{L}(\mathrm{s})$. This proves that $\mathrm{L}=\left(\delta_{1}\right)_{\mathrm{L}} \cup\left(\delta_{2}\right)_{\mathrm{L}} \cup \ldots \cup\left(\delta_{\mathrm{t}}\right)_{\mathrm{L}}$.

Proof: (ii) $\rightarrow$ (iii).
If $s \in S$, then $s R_{L} s$ because for all $u \in S$ and for all $\alpha \in[0,1], L(s u) \geq \alpha$ only when $\mathrm{L}(\mathrm{su}) \geq \alpha$ is obviously true. This proves that $\mathrm{R}_{\mathrm{L}}$ is reflexive. Clearly, $\mathrm{R}_{\mathrm{L}}$ is symmetric. If s $R_{L} t$ and $t R_{L} v$, then for all $u \in S$ and for all $\alpha \in[0,1], L(s u) \geq \alpha$ only when $L(t u) \geq \alpha$ only

## V. Ramaswamy and K.Chatrapathy

when $L(v u) \geq \alpha$ proving that $s R_{L} v$. Hence $R_{L}$ is transitive. $R_{L}$ is thus an equivalence relation.

To prove $R_{L}$ is right invariant, assume that $s R_{L} t$ and $u \in S$. We have to prove that su $R_{L}$ tu. For this, we have to prove that for all $v \in S$ and $\alpha \in[0,1], L(s u v) \geq \alpha$ only when $\mathrm{L}($ tuv $) \geq \alpha$ which is the same as saying that $\mathrm{L}(\mathrm{sz}) \geq \alpha$ only when $\mathrm{L}(\mathrm{tz}) \geq \alpha$ where $\mathrm{z}=\mathrm{uv}$. But this is true since $s R_{L} t$.

We will now prove that $R_{L}$ is of finite index. For $i=1,2, \ldots, t$, let $R_{i}$ denote the right invariant equivalence relation of finite index in $L_{\delta i}$. Let $R=R_{1} \cap R_{2} \cap \ldots \cap R_{t}$. Then $R$ is an equivalence relation of finite index. We will prove that $s R t$ implies $s R_{L} t$. This will mean that index $\left(R_{L}\right) \leq \operatorname{index}(R)$. Since index $(R)$ is finite, this will prove that index $\left(R_{L}\right)$ is also finite.

Assume that s t. Consider any $\mathrm{u} \in \mathrm{S}$ and any $\alpha \in[0,1]$. Suppose $s u \in L_{\alpha}$. We have to prove that tu $\in \mathrm{L}_{\alpha}$. Now $\alpha \leq \mathrm{L}(\mathrm{su})=\delta_{j}$ (say). Then $s u \in \mathrm{~L}_{\delta \mathrm{j}}$ which is a subset of $\mathrm{L}_{\alpha}$. By definition of $R$, we have s $R_{j}$ t. Since $R_{j}$ is right invariant, su $R_{j}$ tu. Since $L_{\delta j}=U[v]_{8 j}$, it follows that su belongs to one of the equivalence classes of $R_{j}$ and hence tu also belongs to the same equivalence class. Hence tu $\in L_{\delta j}$ and since $L_{\delta j}$ is a subset of $L_{\alpha}$, we have $t u \in L_{\alpha}$.

## Proof: (iii) $\rightarrow$ (i)

We have to define a fuzzy automaton $M$ such that $L=L(M)$. For every element $s \in S$, let $[s]$ denote the equivalence class of $s$ under the equivalence relation $R_{L}$.
Let $Q=\{[s] / s \in S\}$. Since $R_{L}$ is of finite index, it follows that $Q$ is a finite set. Define
$\mathrm{I}: \mathrm{Q} \rightarrow[0,1], \mathrm{f}^{*}: \mathrm{Q} \times \mathrm{S} \times \mathrm{Q} \rightarrow[0,1]$ and $\mathrm{F}: \mathrm{Q} \rightarrow[0,1]$ as follows.
$\mathrm{I}([\mathrm{s}])=0$ if $[\mathrm{s}]=[\mathrm{e}]$
$=1$ otherwise.
$\mathrm{f}^{*}([\mathrm{~s}], \mathrm{t},[\mathrm{u}])=1$ if $[\mathrm{u}]=[\mathrm{st}], 0$ otherwise.
$\mathrm{F}([\mathrm{s}])=\mathrm{L}(\mathrm{s})$.
We will first prove that F is well defined. For this, we have to prove that if $[\mathrm{s}]=$ $[t]$, then $L(s)=L(t)$. Assume that $L(s)=\beta$. We will prove that $L(t)=\beta$. Since $[s]=[t], s$ $\mathrm{R}_{\mathrm{L}} \mathrm{t}$ so that $\mathrm{L}(\mathrm{s})=\mathrm{L}(\mathrm{se}) \geq \beta$ only when $\mathrm{L}(\mathrm{t})=\mathrm{L}(\mathrm{te}) \geq \beta$. Since $\mathrm{L}(\mathrm{s}) \geq \beta$, it follows that $\mathrm{L}[\mathrm{t}]$ $\geq \beta$.

Assume $\mathrm{L}[\mathrm{t}]=\gamma>\beta$. Take $\eta=(\beta+\gamma) / 2$. Clearly, $\beta<\eta<\gamma=\mathrm{L}[\mathrm{t}]$. Since $\mathrm{s} \mathrm{R}_{\mathrm{L}} \mathrm{t}$, $\mathrm{L}[\mathrm{t}]$ $>\eta$ implies that $\mathrm{L}[\mathrm{s}] \geq \eta>\beta$. But this contradicts the fact that $\mathrm{L}(\mathrm{s})=\beta$. Hence our assumption that $\mathrm{L}[\mathrm{t}]>\beta$ is wrong. Since $\mathrm{L}[\mathrm{t}] \geq \beta$, it follows that $\mathrm{L}[\mathrm{t}]=\beta$.
Take $M=\left(Q, I, f^{*}, F\right)$. Then $M$ is a fuzzy automaton and it remains to prove that $L=L(M)$. For this, we have to prove that for all $s \in S, L(s)=L(M)(s)$.

## We have

$$
\begin{aligned}
& \mathrm{L}(\mathrm{M})(\mathrm{s})=\mathrm{I}_{\mathrm{o}} \mathrm{f}_{\mathrm{s}}^{*} \text { o F } \\
& =\wedge\left\{\mathrm{I}([\mathrm{t}]) \vee\left(\mathrm{f}^{*}{ }_{\mathrm{s}} \text { o F }\right)([\mathrm{t}])\right\} \\
& \text { [t] } \\
& \left(\mathrm{f}^{*}{ }_{\mathrm{s}} \circ \mathrm{~F}\right)([\mathrm{t}])=\wedge\left\{\mathrm{f}_{\mathrm{s}}([\mathrm{t}],[\mathrm{u}]) \vee \mathrm{F}([\mathrm{u}])\right\} \\
& \text { [u] } \\
& =\wedge\left\{\mathrm{f}^{*}([\mathrm{t}], \mathrm{s},[\mathrm{u}]) \vee \mathrm{F}([\mathrm{u}])\right\} \\
& \text { [u] }
\end{aligned}
$$

Note that $\mathrm{f}^{*}([\mathrm{t}], \mathrm{s},[\mathrm{u}])=0$ if $[\mathrm{ts}]=[\mathrm{u}]$ and 1 otherwise. Therefore, in the above expression $\mathrm{f}^{*}([\mathrm{t}], \mathrm{s},[\mathrm{u}])=0$ only when $[\mathrm{ts}]=[\mathrm{u}]$. In all remaining cases (ie. whenever $\left.[\mathrm{ts}] \neq[\mathrm{u}]\right)$ the term $\mathrm{f}^{*}([\mathrm{t}], \mathrm{s},[\mathrm{u}]) \vee \mathrm{F}([\mathrm{u}])$ becomes 1 . Thus the above equation becomes

## Myhill Nerode Theorem for Fuzzy Automata (Min-max Composition)

$$
\begin{aligned}
\left(\mathrm{f}_{\mathrm{s}} \mathrm{o} F\right)([\mathrm{t}]) & =\mathrm{F}([\mathrm{u}]) \\
& =\mathrm{L}(\mathrm{ts}) \quad(\text { since } \mathrm{F}([\mathrm{~s}])=\mathrm{L}(\mathrm{~s})) .
\end{aligned}
$$

Hence $L(M)(s)=\wedge\left\{I([t]) \vee\left(f^{*}{ }_{\mathrm{s}}\right.\right.$ oF) $\left.([\mathrm{t}])\right\}$
[t]
Note that $\mathrm{I}([\mathrm{t}])=0$ only when $[\mathrm{t}]=[\mathrm{e}], \mathrm{I}([\mathrm{t}])=1$ whenever $[\mathrm{t}] \neq[\mathrm{e}]$. Therefore, $\left\{\mathrm{I}([\mathrm{t}]) \vee\left(\mathrm{f}_{\mathrm{s}} \mathrm{oF}\right)([\mathrm{t}])\right\}=1$ whenever $[\mathrm{t}] \neq[\mathrm{e}]$ and $\left\{\mathrm{I}([\mathrm{t}]) \vee\left(\mathrm{f} *_{\mathrm{s}}\right.\right.$ o F $\left.)([\mathrm{t}])\right\}=\left(\mathrm{f}_{\mathrm{s}} \mathrm{o}\right.$ F) $([\mathrm{t}])$ when $[t]=[e]$. Thus the above equation becomes
$\mathrm{L}(\mathrm{M})(\mathrm{s})=\left(\mathrm{f}^{*}{ }_{\mathrm{s}}\right.$ o F) $([\mathrm{t}])$ where $[\mathrm{t}]=[\mathrm{e}]$.
$=\mathrm{L}(\mathrm{ts}) \quad$ (by the above result )
$=\mathrm{L}(\mathrm{es}) \quad\left(\right.$ since $\mathrm{I}[\mathrm{t}]=0$ when $[\mathrm{t}]=[\mathrm{e}]$ and $\mathrm{R}_{\mathrm{L}}$ is a right invariant relation, $[\mathrm{ts}]=[\mathrm{es}]$ )
$=\mathrm{L}(\mathrm{s})$
Thus for all $s$ all $s \in S, L(s)=L(M)(s)$. This proves that $L=L(M)$.

## 3. Implementation

The algorithm to compute $\mathrm{L}(\mathrm{s})=\mathrm{L}(\mathrm{M})(\mathrm{s})$ for any string s of arbitrary length and any fuzzy automata M with any number of states is developed and implemented in $\mathrm{C}++$. Following procedures are used to compute $f^{*}\left(q_{i}, s, q_{j}\right)$ and $L(s)$ for all $s \in S$ and $q_{i}, q_{j} \in Q$.

Procedure $\operatorname{MinMax}(\mathbf{i}, \mathbf{j}, \mathbf{X}, \mathbf{Y})$. This procedure computes and returns the min-max composition value of row-I of matrix $X$ and column-j of matrix $Y$. $X$ and $Y$ are the $n x n$ transition matrices, min, temp and r are temporary variables.

1. $\min =\infty$
2. for $\mathrm{r}=0$ to $\mathrm{n}-1$ do

$$
2.1 \text { if }(X[i][r] \geq Y[r][j]) \text { then }
$$ temp $=\mathrm{X}[i][j]$

else
temp $=Y[i][j]$
2.2 if (min>temp) then
$\min =$ temp
3. return min

Procedure computeFstar (s). This procedure computes $\mathrm{f}^{*}$ - matrix for the input string s and stores it in nxn matrix A. F0 and F1 are the transition matrices for the input symbols 0 and 1 respectively. The procedure call $\mathbf{C O P Y}(\mathbf{X}, \mathbf{Y})$ copies the matrix X to matrix Y . B is the temporary matrix of size $n \mathrm{x}$ n. The procedure call computeFstar $(\mathrm{X}, \mathrm{Y}, \mathrm{Z})$ computes the $\mathrm{f}^{*}$ value for each pair $\left(q_{i}, q_{j}\right) \in Q \times Q$ using transition matrices $X, Y$ and stores the result in the matrix Z .

1. if $(\mathrm{s}[0]=$ ' 0 ' $)$ then

COPY (A, F0)
else
COPY (A, F1)
2. for $\mathrm{i}=1$ to (length $(\mathrm{s})-1)$ do
if ( $\mathrm{s}[\mathrm{i}]=$ ' 0 ') computeFstar(A, F0, B)
else
computeFstar(A, F1, B)

## V. Ramaswamy and K.Chatrapathy

else
3. $\operatorname{COPY}(A, B)$.
4. Exit

Procedure computeFstarCompF(q). This procedure computes and returns ( $\left.\mathrm{f}_{\mathrm{s}} \mathrm{o} \mathrm{F}\right)(\mathrm{q})$ value for a given state $q \in Q . A$ is the $f_{s^{-}}$matrix for the string $s$.

1. $\min =\infty$
2. for $r=0$ to $n-1$ do
2.1 temp $=\operatorname{MAX}(\mathrm{A}[\mathrm{p}][\mathrm{r}], \mathrm{F}[\mathrm{r}])$
2.2 if (temp < min ) then $\min =$ temp
3. return min

Procedure computeLs. This procedure computes and returns $\mathrm{L}(\mathrm{s})$ value for a given string s .

1. $\min =\infty$
2. for $\mathrm{p}=0$ to $\mathrm{n}-1$ do
2.1 temp $=$ computeFstarCompF $(p)$
2.2 if ( $\mathrm{I}[\mathrm{p}]>$ temp ) then temp $=\mathrm{I}[\mathrm{p}]$
2.3 if (temp < min ) then $\min =$ temp
3. return min

Procedure main( ). This procedure inputs the fuzzy automaton $M=(Q, f, I, F)$, computes and returns $\mathrm{L}(\mathrm{s})$ value for a given input string s . F0, F1, n are transition matrix for 0 , transition matrix 1 and number of states in Q respectively. Fe is the $\mathrm{f}^{*}$-matrix for e . I and F are array of size $n$. Ls stores the $\mathrm{L}(\mathrm{s})$ value of the input string s .

1. read number of states $n$
2. read arrays I and F
3. set $f_{e}^{*}-$ matrix $F e$
4. read transition matrices F0, F1
5. $c h=' y$ '
6. while ( ch = 'y' ) do
6.1 Read input string s
6.2 A = computeFstar(s)
6.3 Ls = computeLs( )
6.4 Print transition matrix A
6.5 Print Ls
6.6 read input character $\mathrm{ch}=$ ' y ' to continue, $\mathrm{ch}=$ ' n ' to stop
7. Exit

The program is tested for large number of fuzzy automata and strings of arbitrary length.

## 4. Example

## Myhill Nerode Theorem for Fuzzy Automata (Min-max Composition)

Let $\Sigma=\{0,1\}$ and $S=\Sigma^{*}$, the set of all strings over the alphabet $\Sigma$. Consider the fuzzy automaton $\mathrm{M}=(\mathrm{Q}, \mathrm{f}, \mathrm{I}, \mathrm{F})$ where $\mathrm{Q}=\left\{\mathrm{q}_{0}, \mathrm{q}_{1}, \mathrm{q}_{2}\right\}$, f is the fuzzy subset $\mathrm{f}: \mathrm{Q} \times \Sigma \times \mathrm{Q} \rightarrow[0,1]$ defined as

$$
\begin{array}{lll}
\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{0}\right)=0.0, & \mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{1}\right)=0.8, & \mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{2}\right)=0.6 \\
\mathrm{f}\left(\mathrm{q}_{1}, 0, \mathrm{q}_{0}\right)=0.5, & \mathrm{f}\left(\mathrm{q}_{1}, 0, \mathrm{q}_{1}\right)=0.0, & \mathrm{f}\left(\mathrm{q}_{1}, 0, \mathrm{q}_{2}\right)=0.7 \\
\mathrm{f}\left(\mathrm{q}_{2}, 0, \mathrm{q}_{0}\right)=0.3, & \mathrm{f}\left(\mathrm{q}_{2}, 0, \mathrm{q}_{1}\right)=0.6, & \mathrm{f}\left(\mathrm{q}_{2}, 0, \mathrm{q}_{2}\right)=0.0 \\
\mathrm{f}\left(\mathrm{q}_{0}, 1, \mathrm{q}_{0}\right)=0.0, & \mathrm{f}\left(\mathrm{q}_{0}, 1, \mathrm{q}_{1}\right)=0.6, & \mathrm{f}\left(\mathrm{q}_{0}, 1, \mathrm{q}_{2}\right)=0.7 \\
\mathrm{f}\left(\mathrm{q}_{1}, 1, \mathrm{q}_{0}\right)=0.5, & \mathrm{f}\left(\mathrm{q}_{1}, 1, \mathrm{q}_{1}\right)=0.0, & \mathrm{f}\left(\mathrm{q}_{1}, 1, \mathrm{q}_{2}\right)=0.8 \\
\mathrm{f}\left(\mathrm{q}_{2}, 1, \mathrm{q}_{0}\right)=0.4, & \mathrm{f}\left(\mathrm{q}_{2}, 1, \mathrm{q}_{1}\right)=0.2, & \mathrm{f}\left(\mathrm{q}_{2}, 1, \mathrm{q}_{2}\right)=0.0
\end{array}
$$

$I=\left\{q_{0}\right\}$ and $F$ is the fuzzy subset of $Q$ defined as $F\left(q_{1}\right)=0.4$ and $F\left(q_{2}\right)=0.9$.
For any string $w=s a$ of length two or more we will calculate $f^{*}\left(q_{i}, w, q_{j}\right)$ as follows:

$$
f^{*}(q, s a, p)=\underset{r \in Q}{\wedge}\left[f^{*}(q, s, r) \vee f(r, a, p)\right] \quad\left(s \in S, a \in A, q_{i}, q_{j} \in Q\right)
$$

After computing $\mathrm{f}^{*}$-matrix for a given string s , we will compute $\mathrm{L}(\mathrm{M})(\mathrm{s})$ as follows:

$$
\begin{align*}
L(M)(s) & =I o f_{0} * o F \\
& =\wedge\left[I(p) \vee\left(f_{s} * o F\right)(p)\right] \\
& p \in Q \\
& =\left[I\left(q_{0}\right) \vee\left(f_{s} * o F\right)\left(q_{0}\right)\right] \wedge\left[I\left(q_{1}\right) \vee\left(f_{s} * o F\right)\left(q_{1}\right)\right] \wedge\left[I\left(q_{2}\right) \vee\left(f_{s} * o F\right)\left(q_{2}\right)\right] \\
& =\left(f_{s} * o F\right)\left(q_{1}\right) \wedge\left(f_{s} * o F\right)\left(q_{2}\right) \tag{11}
\end{align*}
$$

Therefore, for any string $s \in S L(M)(s)=\left(f_{s} * o F\right)\left(q_{1}\right) \wedge\left(f_{s} * o F\right)\left(q_{2}\right)$

$$
\begin{align*}
\left(\mathrm{f}_{\mathrm{s}} * o \mathrm{~F}\right)\left(\mathrm{q}_{1}\right)= & \wedge\left[\mathrm{F}(\mathrm{r}) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{1}, \mathrm{r}\right)\right] \\
& \mathrm{r} \in \mathrm{Q} \\
= & {\left[\mathrm{F}\left(\mathrm{q}_{0}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{1}, \mathrm{q}_{0}\right)\right] \wedge\left[\mathrm{F}\left(\mathrm{q}_{1}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{1}, \mathrm{q}_{1}\right)\right] \wedge\left[\mathrm{F}\left(\mathrm{q}_{2}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{1}, \mathrm{q}_{2}\right)\right] } \\
= & 0.4 \wedge \mathrm{f}_{\mathrm{s}}^{*} *\left(\mathrm{q}_{1}, \mathrm{q}_{0}\right) \wedge\left[0.9 \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{1}, \mathrm{q}_{2}\right)\right] \tag{12}
\end{align*}
$$

Therefore, for any string $s \in S$, $\left.\left(f_{s} * o F\right)\left(q_{1}\right)=0.4 \wedge f_{s} *\left(q_{1}, q_{0}\right) \wedge\left[0.9 \vee f_{s} *\left(q_{1}, q_{2}\right)\right]\right)$

$$
\begin{align*}
\left(\mathrm{f}_{\mathrm{s}} * \circ \mathrm{~F}\right)\left(\mathrm{q}_{2}\right)= & \wedge\left[\mathrm{F}(\mathrm{r}) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{r}\right)\right] \\
& \mathrm{r} \in \mathrm{Q} \\
= & {\left[\mathrm{F}\left(\mathrm{q}_{0}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{q}_{0}\right)\right] \wedge\left[\mathrm{F}\left(\mathrm{q}_{1}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{q}_{1}\right) \wedge\left[\mathrm{F}\left(\mathrm{q}_{2}\right) \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{q}_{2}\right)\right]\right.} \\
= & \left.0.9 \wedge \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{q}_{0}\right)\right] \wedge\left[0.4 \vee \mathrm{f}_{\mathrm{s}} *\left(\mathrm{q}_{2}, \mathrm{q}_{1}\right)\right] \tag{13}
\end{align*}
$$

Therefore for any string $s \in S,\left(f_{s} * o F\right)\left(q_{2}\right)=0.9 \wedge f_{s} *\left(q_{0}, q_{2}\right) \wedge\left[0.4 \vee f_{s} *\left(q_{1}, q_{2}\right)\right]$

$$
\begin{aligned}
\mathrm{L}(0)=\mathrm{L}(\mathrm{M})(0)= & I \text { of } f_{0} * o \mathrm{~F} \\
= & \left(\mathrm{f}_{0} * \text { oF }\right)\left(\mathrm{q}_{1}\right) \wedge\left(\mathrm{f}_{0} * \mathrm{oF}\right)\left(\mathrm{q}_{2}\right) \\
= & \left\{0.4 \wedge \mathrm{f}_{0} *\left(\mathrm{q}_{1}, \mathrm{q}_{0}\right) \wedge\left[0.9 \vee \mathrm{f}_{0} *\left(\mathrm{q}_{1}, \mathrm{q}_{2}\right)\right]\right\} \wedge\left\{0.9 \wedge \mathrm{f}_{0} *\left(\mathrm{q}_{2}, \mathrm{q}_{0}\right) \wedge\right. \\
& {\left.\left[0.4 \vee \mathrm{f}_{0} *\left(\mathrm{q}_{2}, \mathrm{q}_{1}\right)\right]\right\}=0.3 }
\end{aligned}
$$

Similarly, $L(1)=0.4$

$$
\begin{aligned}
& \mathrm{f}_{00} *\left(\mathrm{q}_{0}, \mathrm{q}_{0}\right)=\mathrm{f}^{*}\left(\mathrm{q}_{0}, 00, \mathrm{q}_{0}\right) \\
& \quad=\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{0}\right) \vee \mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{0}\right)\right] \wedge\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{1}\right) \vee \mathrm{f}\left(\mathrm{q}_{1}, 0, \mathrm{q}_{0}\right)\right] \wedge\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{2}\right) \vee \mathrm{f}\left(\mathrm{q}_{2}, 0, \mathrm{q}_{0}\right)\right]=0
\end{aligned}
$$

## V. Ramaswamy and K.Chatrapathy

$$
\begin{aligned}
\mathrm{f}_{00} *\left(\mathrm{q}_{0}, \mathrm{q}_{1}\right)= & \mathrm{f}^{*}\left(\mathrm{q}_{0}, 00, \mathrm{q}_{0}\right) \\
= & {\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{0}\right) \vee \mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{1}\right)\right] \wedge\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{1}\right) \vee \mathrm{f}\left(\mathrm{q}_{1}, 0, \mathrm{q}_{1}\right)\right] \wedge } \\
& {\left[\mathrm{f}\left(\mathrm{q}_{0}, 0, \mathrm{q}_{2}\right) \vee \mathrm{f}\left(\mathrm{q}_{2}, 0, \mathrm{q}_{1}\right)\right]=0.6 }
\end{aligned}
$$

Similarly, the $\mathrm{f}_{00}{ }^{*-}$ matrix is computed as follows;

| $\mathrm{f}_{00} *\left(\mathrm{q}_{0}, \mathrm{q}_{0}\right)=0$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{0}, \mathrm{q}_{1}\right)=0.6$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{0}, \mathrm{q}_{2}\right)=0.6$ |
| :--- | :--- | :--- |
| $\mathrm{f}_{00} *\left(\mathrm{q}_{1}, \mathrm{q}_{0}\right)=0.5$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{1}, \mathrm{q}_{1}\right)=0$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{1}, \mathrm{q}_{2}\right)=0.6$ |
| $\mathrm{f}_{00} *\left(\mathrm{q}_{2}, \mathrm{q}_{0}\right)=0.3$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{2}, \mathrm{q}_{1}\right)=0.6$ | $\mathrm{f}_{00} *\left(\mathrm{q}_{2}, \mathrm{q}_{2}\right)=0$ |

$$
\begin{aligned}
\mathrm{L}(00) & =\left(\mathrm{f}_{00} * o \mathrm{~F}\right)\left(\mathrm{q}_{1}\right) \wedge\left(\mathrm{f}_{00} * \mathrm{oF}\right)\left(\mathrm{q}_{2}\right) \\
& =\left\{0.4 \wedge \mathrm{f}_{00} *\left(\mathrm{q}_{1}, \mathrm{q}_{0}\right) \wedge\left[0.9 \vee \mathrm{f}_{00} *\left(\mathrm{q}_{1}, \mathrm{q}_{2}\right)\right]\right\} \wedge\left\{0.9 \wedge \mathrm{f}_{00} *\left(\mathrm{q}_{2,}, \mathrm{q}_{0}\right) \wedge\left[0.4 \vee \mathrm{f}_{00} *\left(\mathrm{q}_{2}, \mathrm{q}_{1}\right)\right]\right\} \\
& =\{0.4 \wedge 0.5 \wedge[0.9 \vee 0.6]\} \wedge\{0.9 \wedge 0.3 \wedge[0.4 \vee 0.6]\}=0.3
\end{aligned}
$$

Using the program for the example fuzzy automata, $\mathrm{f}^{*}{ }_{\mathrm{s}}$ - matrix and $\mathrm{L}(\mathrm{s})$ values are computed for various strings and the same values are checked using manual calculations. Both manually calculated values and computer results are tallied. Some of the $\mathrm{L}(\mathrm{s})$ values are as follows.
$\mathrm{L}(0)=0.3, \mathrm{~L}(1)=0.4, \mathrm{~L}(00)=\mathrm{L}(01)=\mathrm{L}(10)=0.3, \mathrm{~L}(11)=0.4, \mathrm{~L}(000)=\mathrm{L}(001)=\ldots \mathrm{L}(110)=$ $0.3, \mathrm{~L}(111)=0.4$,
$\mathrm{L}(0000)=. . . \mathrm{L}(1110)=0.3, \mathrm{~L}(1111)=0.4$,
$\mathrm{L}(00000000)=0.3, \mathrm{~L}(00001111)=0.3, \mathrm{~L}(11110000)=0.3, \mathrm{~L}(01011100)=0.3$,
$\mathrm{L}(11010110101)=0.3, \mathrm{~L}(0010101000011)=0.3$,
$\mathrm{L}(11010101001001101010001)=0.3, \mathrm{~L}(111111111111111)=0.4$,
$\mathrm{L}(1111111111111111)=0.4$.
It is found that $\mathrm{L}(\mathrm{s})=0.4$ only when every symbol in s is 1 . Otherwise, $\mathrm{L}(\mathrm{s})=0.3$.
The possible values of $\delta_{i}$ (after arranging them in nondecreasing order) are 0.3, 0.4.
Suppose $0<\alpha \leq 0.3$.
Let $D_{\alpha}(M)=M_{\alpha}$ denote the nondeterministic automaton corresponding to $\alpha$.
Then $\mathrm{I}_{\alpha}=\left\{\mathrm{q}_{0}\right\}, \mathrm{F}_{\alpha}=\{\mathrm{q} 1, \mathrm{q} 2\}, \mathrm{d}_{\alpha}\left(\mathrm{q}_{0}, \mathrm{~s}\right)=\left\{\mathrm{p} \in \mathrm{Q} / \mathrm{f}_{0}{ }^{*}\left(\mathrm{q}_{0}, \mathrm{~s}\right) \geq 0.3\right\}=\left\{\mathrm{q}_{1}, \mathrm{q}_{2}\right\}$
$\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)=\left\{\mathrm{s} \in \mathrm{S} /\right.$ there exists $\mathrm{q} \in \mathrm{I}_{\alpha}$ such that $\left.\left(\mathrm{d}_{\alpha}(\mathrm{q}, \mathrm{s}) \cap \mathrm{F}_{\alpha}\right) \neq \phi\right\}$

$$
=\left\{\mathrm{s} \in \mathrm{~S} / \text { there exists } \mathrm{q} \in \mathrm{I}_{0.3} \text { such that }\left(\mathrm{d}_{0.3}(\mathrm{q}, \mathrm{~s}) \cap \mathrm{F}_{0.3}\right) \neq \phi\right\}
$$

$$
=\{0,1\}^{+}
$$

$\mathrm{L}_{\alpha}=\{\mathrm{s} \in \mathrm{S} / \mathrm{L}(\mathrm{s}) \geq \alpha\}$
$=\{s \in S / L(s) \geq 0.3\}$

$$
=\{0,1\}^{+}
$$

$\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)=\mathrm{L}_{\alpha}$.
Furthermore, $[0]_{\alpha}=\{0,01,10,000,001,010,110,0000,1110,00000, \ldots \ldots .11110 . \ldots$.

$$
[1]_{\alpha}=\{1,11,111,1111, \ldots \ldots \ldots\}
$$

$$
\mathrm{L}_{\alpha}=\cup[\mathrm{s}]_{\alpha}=[0]_{\alpha} \cup[1]_{\alpha} .
$$

Suppose $0.3<\alpha \leq 0.4$.
Let $D_{\alpha}(M)=M_{\alpha}$ denote the nondeterministic automaton corresponding to $\alpha$.
Then $I_{\alpha}=\left\{\mathrm{q}_{0}\right\}, \mathrm{F}_{\alpha}=\{\mathrm{q} 1, \mathrm{q} 2\}, \mathrm{d}_{\alpha}\left(\mathrm{q}_{0}, \mathrm{~s}\right)=\left\{\mathrm{p} \in \mathrm{Q} / \mathrm{f}_{0}{ }^{*}\left(\mathrm{q}_{0}, \mathrm{~s}\right) \geq 0.4\right\}=\{\mathrm{q} 1, \mathrm{q} 2\}$
$\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)=\left\{\mathrm{s} \in \mathrm{S} /\right.$ there exists $\mathrm{q} \in \mathrm{I}_{\alpha}$ such that $\left.\left(\mathrm{d}_{\alpha}(\mathrm{q}, \mathrm{s}) \cap \mathrm{F}_{\alpha}\right) \neq \phi\right\}$

$$
=\left\{\mathrm{s} \in \mathrm{~S} / \text { there exists } \mathrm{q} \in \mathrm{I}_{0.4} \text { such that }\left(\mathrm{d}_{0.4}(\mathrm{q}, \mathrm{~s}) \cap \mathrm{F}_{0.4}\right) \neq \phi\right\}=\{0,1\}^{+}
$$

$\mathrm{L}_{\alpha}=\{\mathrm{s} \in \mathrm{S} / \mathrm{L}(\mathrm{s}) \geq \alpha\}$

## Myhill Nerode Theorem for Fuzzy Automata (Min-max Composition)

$$
=\{s \in S / L(s) \geq 0.4\}=\{1\}^{+}
$$

$\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right) \neq \mathrm{L}_{\alpha}$ and also $\mathrm{L}_{\alpha} \subseteq \mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)$.
Furthermore, $[1]_{\alpha=}\{1,11,111,1111 \ldots\}$

$$
\mathrm{L}_{\alpha}=\cup[\mathrm{s}]_{\alpha}=[1]_{\alpha} .
$$

If $\alpha>0.4$, then there exists no corresponding nondeterministic automaton and $\mathrm{L}\left(\mathrm{D}_{\alpha}(\mathrm{M})\right)=$ $\mathrm{L}_{\alpha}=\phi$.
When $\alpha=0.3$

$$
\begin{aligned}
& \alpha_{L}(s)=\alpha \text { if } \mathrm{L}(\mathrm{~s}) \geq \alpha, 0 \text { otherwise. } \\
& \alpha_{\mathrm{L}}(0)=\alpha_{\mathrm{L}}(00)=\alpha_{\mathrm{L}}(01)=\alpha_{\mathrm{L}}(10)=\alpha_{\mathrm{L}}(000)=\ldots \alpha_{\mathrm{L}}(110)=\alpha_{\mathrm{L}}(0000)=\ldots \alpha_{\mathrm{L}}(1110)= \\
& \ldots .=0.3 \\
& \alpha_{\mathrm{L}}(1)=\alpha_{\mathrm{L}}(11)=\alpha_{\mathrm{L}}(111)=\alpha_{\mathrm{L}}(1111)=\ldots \quad \alpha_{\mathrm{L}}(11111 \ldots 111)=0
\end{aligned}
$$

When $\alpha=0.4$
$\alpha_{\mathrm{L}}(\mathrm{s})=\alpha$ if $\mathrm{L}(\mathrm{s}) \geq \alpha, 0$ otherwise.
$\alpha_{\mathrm{L}}(0)=\alpha_{\mathrm{L}}(00)=\alpha_{\mathrm{L}}(01)=\alpha_{\mathrm{L}}(10)=\alpha_{\mathrm{L}}(000)=\ldots \alpha_{\mathrm{L}}(110)=\alpha_{\mathrm{L}}(0000)=\ldots \alpha_{\mathrm{L}}(1110)=0$
$\alpha_{L}(1)=\alpha_{L}(11)=\alpha_{L}(111)=\alpha_{L}(1111)=\ldots \quad \alpha_{L}(11111 \ldots 111)=0.4$
$\mathrm{L}=\cup \alpha_{\mathrm{L}}$ where $\cup$ denotes fuzzy union.
$\alpha \in[0,1]$
$\left(\cup \alpha_{L}\right)(0)=\vee \alpha_{L}(0)=0.3 \vee 0=0.3=\mathrm{L}(0)$
$\left(\cup \alpha_{\mathrm{L}}\right)(1)=\vee \alpha_{\mathrm{L}}(1)=0 \vee 0.4=0.4=\mathrm{L}(1)$
Similarly, $\left(\cup \alpha_{L}\right)(s)=\vee \alpha_{L}(s)=0.3 \vee 0=0.3=L(s)$ for all $s \in S$.
This verifies $L=\cup \alpha_{L}$

## 5. Results and Conclusions

In this paper, Myhill Nerode theorem of finite automaton has been extended to fuzzy automaton where the composition considered is min-max composition. The algorithm to compute $f^{*}\left(q_{i}, s, q_{j}\right)$ and $L(s)$ is developed and implemented in $C++$. The program is tested with different fuzzy automata and strings of different lengths. In min-max composition, it is found that $L_{\alpha}$ need not even be contained in $L\left(D_{\alpha}(M)\right)$. Anyway, we have been able to prove the analogue of Myhill Nerode Theorem for fuzzy automata even for min-max composition.
